

OSINT ASSIGNMENT

NAME SURNAME – STUDENT NUMBER

RULES OF THE ASSIGNMENT

Write a report for this assignment using this layout. Write name, surname and student number and save it as a PDF file with the name <name>_<surname>_<student_number>_osint.pdf, and upload it to the Teams' Assignment section.

Every task must be carried out using the presented tools. Answer every question with a **clear and concise** comment, and suitable screenshots of the found results. In particular, **indicate every single module** you run along with the **options** you set, and take a screenshot of its info section after setting the options and before running the module.

PRELIMINARY STEP

Create a new workspace for your assignment, called:

<your_name_first_letter>_<your_surname_second_letter>@unica

Example: John Doe → j_d@unica

PART 1

SCENARIO: After a forensics analysis we found out that someone attacked one of the USA Big Companies: **Microsoft**. You have to analyse their websites (microsoft.com) looking for specific files like robots, sitemap, interesting files, contacts related to the company that may be the attack insider, etc. Then, retrieve as much information as possible about the retrieved domain.

PART 2

SCENARIO: We suspect that a professional hacker, whose nickname is “xenaw.arrior1”, is behind the attack. Can you help us retrieving some information about this person:

1. Are you able to find her social networks and find out her real name?

2. We believe that she is one of the strongest IT software engineers and plays Capture the Flag competitions with one of the strongest team in all Europe. Where is she working now, and which is her team?
3. We believe that she posted something regarding the attacks to Microsoft. Are you able to find it and explain which kind of attack she did to gain first access?
4. We are sure that we can find her exact location. Are you able to retrieve the GPS coordinates of her house and work?

FINAL PART

Create an HTML report of your whole workspace, setting your name and surname as the CREATOR and osint_lab as the CUSTOMER (if you use the Kali Linux virtual machine, you can upload the HTML file together with the solution). Create also a detailed report with the data found in “PART 2” (no report from recon-ng is necessary for part 2).
